All About Me

I'm a lifelong autodidactic polyglot software junkie.

I logged into my first UNIX account in '89, I read my first usenet newsgroup in 1990, I hacked together my first Perl script in 1991, I joined my first IRC channel in 1992 and in 1993 I downloaded Mosaic 1.0 and wrote my first web page.

At the end of 1993 I dropped out of university when they told me that most graduates would end up working in a bank writing COBOL. I worked hard for the next year before taking a job with a small startup that went on to become the largest ISP in Australia with over a million subscribers. I've been creating elegant solutions to complex problems ever since.

I'm passionate about creating value: value to a user; value to a customer; ultimately value to the organizations I work in.

I also love helping others with the technologies that I love, I'm a regular on IRC, StackOverflow, and a few other places around the internet, and I've contributed to and published a handful of Ruby gems.

What I'm Seeking

I want to love *what* I do, *who* I do it with, and *how* I do it.

I want to work in a culture of innovation, one that accepts mistakes as a key part of the creative process, I make a lot of mistakes and I want to work with people who know how great that is.

I want to work in an organization that recognizes and rewards team members based on their value and contribution to the organization's goals, an organization that values logic and reason over popularity, tradition and authority.

I want to work in a team that's empowered with the responsibility, commitment and motivation that comes from sharing the vision of the company and feeling a sense of autonomy and ownership for the products we create.

I want a company where logic and reason trump authority and tradition, a company who operates from first principles to find the best way to do something, rather than just doing things the way they've always been done.

I want a company that understands the value of releasing fewer features earlier, of delivering quality over quantity and the importance of understanding the problem before trying to solve it.

How I Keep Busy

Use the links in the sidebar if this is a soft-copy, but here are the full links if printed:

Experience

JANUARY 2015 – PRESENT

PeerStreet, Inc. (30 employees, real estate debt marketplace)

Senior Software Engineer

I was the 4th programming hire and so my time with PeerStreet has been spent both building out new features in preparation for launch (in November 2015) as well as a lot of clean up and maturing of prototype-quality code.

JUNE 2009 – DECEMBER 2014

International Education Services - t/a "Amco" (500 employees, education, ESL)

VP of Engineering / Lead Software Engineer

When I started with Amco there was an in-house development team that had grown without direction, lots of "copy-and-pasters" rather than programmers, there was a culture of walk-ups (by the Founder/CEO), hacking things in situ (in production) with very loose processes.

I reformed the IT program at Amco, implementing a training and assessment program, replacing those team members who weren't able to demonstrate satisfactory progress, instigating change control, testing, backups, logging, analytics, issue tracking and numerous other processes to bring quality up to an acceptable level.

I leave Amco with a thriving IT group, a culture of innovation, creativity, mentorship and teamwork. Hosting has been migrated to a scalable cloud-based platform, security vulnerabilities have been fixed, error handling and overall code quality massively improved.

JULY 2006 – JANUARY 2009

Handle IT (my own company)

Senior Software Engineer, Consultant, Sales & Team Leader

I led a small team of mostly remote developers in a bunch of small web projects. Solid Ruby on Rails development, with some JavaScript wizards using Prototype. In our spare time we built Freedraw, a Rails app with a stack of JavaScript in the front end, to make it easier for our remote team to exchange visual ideas – especially with designers. I also provided IT strategy consultation services to a few local companies with Ruby on Rails as my preferred technology.

JULY 2007 – MARCH 2008

Optus (6000 employees, telecommunications & ISP)

Senior Software Engineer

I came back to the same Internal Applications team at Optus and developed an AJAX interface for customer support teams to adjust the Speed Profiles of a customer's ADSL modem by talking to the live SOAP (WSDL) interface on the modem control server. Also produced a report system sourcing data from Postgres DBs and producing the reports in fully formatted, multi-worksheet Microsoft Excel files (not just CSVs).

FEBRUARY 2007 – JUNE 2007

News Digital Media (50 employees, digital media division of News Limited, online content delivery)

Senior Software Engineer

A short project for News to rewrite some very high profile legacy applications that were failing with no notification. The first of these was the data processing app for the live sports scores on foxsports.com.au. I developed a robust Perl app called *Ingestor* which had logging and alerting built into it. It was an extensible framework which allowed me to extend it quickly with a new input filter module to deliver the next project: a system to process User Generated Content (UGC) that the public would send in via SMS and MMS from their phones and which would then be fed into the news.com.au CMS for review, approval and potential publication.

Showing the full flexibility of the system, I then added another input and output filter in order to ingest a SOAP feed from WebSideStory (aka HBX, now owned by Omniture) to create the *Most Popular* list of news and blogs across all the mastheads.

JULY 2006 – JANUARY 2007

Optus (6000 employees, telecommunication & ISP)

Senior Software Engineer

Working in the Internal Applications team I made a number of enhancements to the Perl, mod_perl, Mason based customer support tools. I implemented a new VoIP provisioning system, an on-demand data migration system, and a number of other enhancements.

FEBRUARY 2004 – JUNE 2006

Unwired Australia (30 employees, startup wireless ISP)

Senior Software Engineer

I was with Unwired during their startup phase, from pre-launch to around 20,000 customers. The development team grew from 5 to 12. I developed the wireless service qualification tool in mod_perl (for significant cost savings over the commercial services available at the time), the reseller provisioning interface in PHP and XML-RPC, mail interface for single-password in PHP, and restructured the Money Back Guarantee system to implement new billing processes.

JANUARY 2001 – MAY 2003

Telstra (46,000 employees, telecoms & ISP)

Senior Systems Integrator

Working in the business and custom hosting team, we were the development team for the high end web hosting products from Telstra. I rewrote the Perl-based hosting provisioning system cutting the running time from 36 minutes per cycle, to around 25 seconds. I then planned, prepared and implemented the migration of over 60,000 websites from an old NT4/ Netscape platform to a clustered Win2000/IIS6 platform with the storage mapped to a NAS back-end.

I also ran in-house training sessions on OO programming with Perl 5.6, and mentored the junior team members through the transition from 5.005_03 to 5.6. Also some other smaller tasks in ASP (vbScript) and C++.

JULY 1997 – JANUARY 2002

Squirrel Group (my own company)

Web Developer & Managing Director

Ran my own web development company for five years providing a number of custom solutions to various companies including: Sydney Airports, HCF, BodyScoop and TownB. This included scoping, quoting, management, leadership and training of two Perl developers, liaising with the client and providing support and maintenance to the client post-implementation.

FEBRUARY 1998 – OCTOBER 2000

Ian Pridham Pty Limited (10 employees, became Alien Technology, IT development services)

Software Engineer

Worked in a large team as one of two head developers on a number of projects in Java, Delphi, Visual Basic and C++. Was the stand-in administrator for UNIX web and mail hosting as well as WindowsNT network and domain.

OCTOBER 1996 – FEBRUARY 1998

Bigpond Consulting (10 employees, IT consulting and development services)

Technical Consultant

Web development work in HTML, CSS and ASP. Working on a project with the National Farmer's Federation (NFF) called Farmwide. Headed the team to deliver a range of internet based products to members of the NFF Australia-wide.

SEPTEMBER 1995 – FEBRUARY 1998

On Australia (20 employees, became Telstra Bigpond, startup ISP)

Web Developer

Was part of the original development team of 5 developers from pre-launch until 50,000 customers. I built the template-based web-hosting product in ASP, much of the MSSQL online billing system and group billing systems, mail system integration, Radius server integration, system to auto-publish chat transcripts from IRC sessions, and a number of other internal and customer-facing products and systems.
